

Betterflye CMS

Iteration 5

Client Feedback

- Happy with new features, said we finished all the major ones her users requested
- Will be useful when they start adding new users to the platform
- Feedback on flag UI:
 - add number of times flagged
 - add notification
 - will be done by main Betterflye team

Mentor Feedback

Mid-Iteration:

- Liked that we added the option for org admins to unban users from their orgs
- Liked that we fixed the UI of the org admin settings list as requested

End of Iteration:

- Liked the features and felt that they were well-integrated in the main Betterflye project
- Also felt that we met the goals that we set for ourselves

Software Use

Mentor:

- Michael liked the way the features flow. He mentioned a settings toggle for the organization approval and blacklist features would be nice. He also noted the pending message is slightly off center and could use some resizing.

Client:

- Virginie liked everything, noted notifications would be nice to have. Agreed with Michaels feedback

Teamwork: Sara

- Org admins can see, delete, or ignore flags from their organization
- Custom org blacklist implementation
- Debugging and maintenance

Teamwork: Jake

- Made edits to previous iteration features based on feedback (current banned user view, option to unban user, UI fixes)
- Created admin post approval feature
- Added backend testing for new features

Teamwork: Dan

- Helped go through and work on bug fixes

Teamwork: Daniel

- Image filtering

Interesting Fact

- While NASA catalogs all the asteroids in the asteroid belt, they don't actually take them into account when firing probes and such through it because it's so spaced out that there's a very low chance of them actually hitting the probe. Densely packed asteroid fields where you'd have to dodge and weave through them are pretty much sci-fi.
- NASA estimates the natural collision rate between two asteroids in the asteroid belt to be once every ten million years.
