Betterflye Content Management Iteration 1

Betterflye Content Management Team

- Sara Bailey

- Jake Dibble

- Dan Gonzalez

- Daniel Spencer

Client Information

- **Client:** Virginie McNamar, Betterflye LLC
- **Mentor:** Michael Himes

Goal: Betterflye is a start-up social media platform for nonprofits to raise funds and find volunteers. Users are able to track their donations across all companies. Our goal is to create a filtering system to prevent inappropriate content from being posted by users.

Mentor Feedback

Mid Iteration

- Talked about similarity to original Betterflye team's documentation
- Discussed user guide needing to only contain our functionality
- Deployment doc will remain largely the same, as site is already officially deployed

What we changed

- Edited Development.md to include more precise details for replicating environment in regards to editing database connection info, and allowing access to site from xampp.
- Changed our user guide to describe only our functionality

Mentor Feedback

Before Client meeting

- Approved all Iteration 1 documents, mentioned to check often for updates to database sql file that we included in our repo
- Approved building the filter internally into existing project as it works better for the client
- Liked the regex filter and use of pre-existing notification system
- Told us he would discuss the notification system with the client if a different implementation was wanted

What we changed

- Added editing the notification system to Iteration 2 features

Client Feedback

- Design Meeting
  - All documents were approved
- First Iteration Presentation
  - Approved of progress made on filter- met the client's basic needs
  - Liked notification system
  - Major text input areas were covered
  - wants to make sure that every possible area where text could be input was covered by the filter
  - Suggested blacklist/whitelist for admins

Client Feedback

What We Changed:

- Based Iteration features on the client's priorities
- Split 'Admin' role into Admin and Manager in design

What We are Planning to Change

- Filter will be implemented on every possible text input area
- Implementing whitelist/blacklist feature for admins to adjust blocked words

Iteration 2 Features

In Progress:

- User shall receive an alert if their upload is blocked by the filter

TODO:

- Admin shall receive an alert when a user/organization upload is blocked. This message will contain the appropriate identifying information (User ID, Content, etc)
- Filter implementation for Organization and Initiative inputs and associated material

What is a Heritage Turkey?

- Heritage turkeys are old-fashioned breeds with smaller breasts, darker leg meat and heftier price tags than conventionally raised turkeys
- Heritage turkeys are not injected with water, salt, and other preservatives during processing, unlike conventional turkeys from the supermarket. Because of this, many find Heritage turkeys to be less salty and have better flavor.
